OK. Yes, that makes more sense and I see that now – differentiating between PFAS and metals. Please see our revised response below and let me know ASAP if we can send forward:

=====

**Reporter's additional/revised questions:**

- 1. I had asked during the meeting in Blades if the private wells that were tested for PFAS were also tested for metals. I'd like to double-check whether they were or not? I'm not seeing any indication in the documentation that they were. If that's the case, could you tell me why not?**
- 2. I also wanted to ask someone at EPA why Blades is being proposed for Superfund listing, but not other PFAS contaminated sites in the state? Is it because of the metals contamination? Because of economic reasons?**
- 3. How many comments from the public did EPA receive on this proposed listing?**
- 4. I was hoping to speak with someone to specifically go over some of the sample results in Weston's final summary report dated June 2019 to better understand the concentrations and results, if there's any chance we could set up a phone call for that tomorrow. I'm not a scientist by any means, and am trying to make heads-or-tails of how bad this contamination is, and what the potential threat to public health is, particularly for people on unregulated private wells (I do understand that the town's water is being treated, regulated and falling within Safe Drinking Water parameters).**
- 5. Maybe shedding some light on how the EPA's HRS ranking works, and how Blades really ranks on a scale of some clean up needed to a Love Canal situation? Anything you all can do to help me keep this accurate and in perspective would be great.**

**Reporter's Original Questions:**

I have a couple simple follow-up questions about the proposal to list Blades' groundwater as a Superfund site. Amanda or Daniel, would either of you have a couple minutes to chat briefly today or tomorrow?

I'd like to double-check on the status of metals contamination and get some clarity for our readers on why this site is being proposed vs. other PFAS sites in Delaware, and to make sure I have the possible timeline of this process accurate.

### **EPA Region 3 Proposed Response:**

The Blades Groundwater Site (Site) was studied by the EPA's Superfund Site Assessment Program from the spring of 2017 to present. Several metals, which are common electroplating compounds, including chromium, cobalt, nickel, zinc, and hexavalent chromium, and PFAS were detected at onsite and offsite monitoring wells (with varying concentrations) that could pose a potential risk to human health and the environment.

Results of this Site assessment warranted the Blades Site being proposed to the National Priorities List (NPL). PFAS compounds have been detected in the three Town of Blades municipal wells, monitoring wells installed throughout the town, and domestic wells (also tested previously for metals by Delaware Department of Natural Resources and Environmental Control (DNREC)) located outside the town limits of Blades. As a removal action, DNREC, in cooperation with EPA, ensured that the public wells were connected to a treatment system and the domestic wells whose concentrations exceeded the Health Advisory Limit for PFAS compounds (70 parts per trillion) were provided a treatment system to prevent exposure of PFAS above the Health Advisory Limit.

The information gathered during the Site Investigation indicated the Site is a candidate for further EPA remedial investigation and potential remedial action to address the contaminated ground water. Lastly, DNREC requested EPA's assistance to ensure protection of public drinking water wells, over 100 residential wells, surface water, and wetlands surrounding the Site that may have been exposed to electroplating compounds and PFAS. EPA will continue to work concurrently with DNREC to investigate areas throughout the State to determine if an area should be proposed to the National Priority List and become eligible for long term remedial cleanup activities.

The public comment period for the Site proposal to be added to the NPL began *November 8, 2019* and ended January 7, 2020. Four comments from the public were submitted during the public comment period. They can be accessed at <https://www.regulations.gov/docket?D=EPA-HQ-OLEM-2019-0484>. EPA conducted a public meeting Dec. 5. EPA will review all comments submitted and make a determination if the Site will be added to the NPL. There are two opportunities for a Site to be added to the NPL; the spring and fall. If Blades Groundwater Superfund Site is added to the NPL, it will likely be during this time.

Please refer to the following websites for explanations on the Superfund program and the Hazard Ranking System (HRS), regarding how the process works for adding Sites onto the NPL: <https://www.epa.gov/superfund>, <https://www.epa.gov/superfund/superfund-site-assessment-process> and <https://www.epa.gov/superfund/introduction-hazard-ranking-system-hrs>.

After a Site is added to the NPL, EPA will begin the Remedial Investigation phase to fully define the nature and extent of contamination and the Feasibility Study to evaluate alternatives to clean up the Site. Risks associated with the site will be evaluated in detail during the Remedial Investigation through a risk assessment. At this time, potential risks are being dealt with through treatment systems on the public supply and impacted private wells. EPA will then issue a Proposed plan, describing the method to cleanup a Site, and then a Record of Decision documenting this decision. EPA will then begin the cleanup phase to restore a Site back to beneficial use. During the entire process EPA will continuously provide information and updates to the public.

**Subject:** RE: MEDIA INQUIRY: The News Journal Media Group (Sussex Co) - Blades clean-up follow-up questions

Thanks for the follow-up, Jeff.

Perhaps I'm misunderstanding the reporter's question. I thought the reporter is asking whether metals were tested for in the domestic wells:

**I had asked during the meeting in Blades if the private wells that were tested for PFAS were also tested for metals. I'd like to double-check whether they were or not? I'm not seeing any indication in the documentation that they were. If that's the case, could you tell me why not?**

EPA did not test the wells for metals. DNREC did during a previous sampling event.

**Subject:** RE: Blades Superfund proposal follow-up/fact-check

Hi Dan,  
Thanks for raising this. It would be great if Connor, you and Amanda craft a draft response and then Amie and I can make sure the chain is comfortable before you get back to the reporter.

**Subject:** FW: Blades Superfund proposal follow-up/fact-check

Connor, I thought part of this question may be relevant for you since it is talking about getting a Site listed. Charlie and Amie, with the sensitivity about PFAS, I thought you should be aware of the question if there was a particular way management wants to address PFAS.

**Subject:** Blades Superfund proposal follow-up/fact-check

Hello EPA team,

I have a couple simple follow-up questions about the proposal to list Blades' groundwater as a Superfund site. Amanda or Daniel, would either of you have a couple minutes to chat briefly today or tomorrow?

I'd like to double-check on the status of metals contamination and get some clarity for our readers on why this site is being proposed vs. other PFAS sites in Delaware, and to make sure I have the possible timeline of this process accurate.

I look forward to hearing from someone.

Thanks,
